

The Bertins on mountain bike

Abriès-Ristolas

(Benjamin Musella - PNR Queyras)

The balcony trail, out to discover the ancient hamlets of mountain pastures.

A discovery of the ancient hamlets of mountain pastures of farmers from Abriès. You will walk along a balcony trail overlooking the Guil and located at the heart of a Natura 2000 site.

Useful information

Practice : MOUNTAIN BIKE

Duration : 3 h 30

Length : 13.0 km

Trek ascent : 586 m

Difficulty : Medium

Type : Boucle

Themes : Fauna

Trek

Departure : Abriès

Arrival : Abriès

Markings :  GR®  PR

At the top of the parking lot, follow the hairpin bend on the left and at the exit, immediately take the road going up on the right. Follow this road until it becomes a dirt road.

1 - From here, turn left and take a rising false flat track. Leave a sheep pen on the right and follow the track going down.

2 - Reach a cabin, turn right onto the quickly shrinking track leading to the bottom of the valley in the forgotten hamlet of the Bertins.

3 - Reach the GR58, turn left and take the single track. First, follow the bottom of the valley, then join the left mountain slope left continue on the balcony trail. Cross the hamlet of Malrif and after a technical passage (porting is possible), find a balcony single track. Stay on the mountain slope until reaching Abriès and the parking area.

All useful information

Advices

From the same car park, it is possible to walk to the Bertins through a more pastoral path. Follow the route described above. At a large hairpin bend on the right of the track, take the left path and regain directly the Tirail. From there, turn right, climb and reach the Canal Neuf, turn left and follow the canal to the Bertins.

Altimetric profile

Min elevation 1546 m

Max elevation 2115 m

The Great Green Bush-Cricket (B)

Like all katydids, the Great Green Bush-Cricket has long and thin antennae. They can reach up to 3 times the size of the body. In contrast, short-horned grasshoppers have short and articulated antennae. The Great Green Bush-Cricket likes open areas, meadows, grasslands, bushes ... Sometimes eating plants, it feeds primarily on other insects, caterpillars and larvae, which makes it very useful for gardeners!

Chamois (C)

In spring, the chamois leave the forest which fed and protected them during the winter. Little by little, they go in search of the first tufts of grass. The males find their solitary life they will lead until the rutting (early November). As for the females, they isolate themselves in June to give birth. They prefer ridges and steep and difficult places of access where predators will have a hard time getting to. After a week, the female and the kid join the herd.

Pyrrhocoris apterus (D)

Commonly known as firebug, this inodorous bug measures about 1cm. It lives in small groups often at the base of trees and feeds mainly on seeds. It can also eat the eggs of other insects and even dead insects. Mating occurs in spring, it is amazing due to the fact that it lasts many hours. We can easily observe the individual bugs move around backwards during coupling. The female lays between 50 to 60 eggs in a burrow it digs into a wetland. The larvae hatch in May and become adult at the beginning of winter.

Willow (E)

Used for medicinal purposes, basketry, tool handle, willows have multiple uses. A common use for some 360 species of willows is "willow water". Excellent for cuttings, layering or strengthening weak trees, willow water is today replaced by auxin. 2 types of productions are possible: crush the branches and let them soak in water (24hrs). Or, leave the willow cuttings 5 to 6 weeks in water. ? After these 5 to 6 weeks, the cuttings are ready and the water has become a slippery gel ideal for cuttings.

Petrification (F)

By gravity, the water seeps. Sometimes it passes areas which are heated by volcanic activity. The water heats, dissolves minerals it carries and charges up in carbon dioxide. Lightened by the carbon dioxide, it goes back up and retrieves minerals. Once in the open area, the chemical reaction (high level of CO₂, air, water movement) allows the limestone to deposit itself on everything it touches. Strategically place any object for several months in the water, it will be petrified.
