

Aiguebrun valley

Buoux

Baume du vallon (©Eric Garnier - PNR Luberon)

The magical trilogy! Aiguebrun, the plateau of Claparèdes and picturesque villages. The soul of Luberon...

« Because of my job and my passion for rock climbing, mountain biking and hiking, there are few corners of the valley that I do not know of.! And yet, I still happen to discover a unique facet. I love the wild side of the place, the beautiful rounded volumes of stones, the tails of the jackdaws, the light sectioned on the ground cover, but also the delicate presence of man at all stages of this paradise.! ». Eric Garnier, Head of Studies for outdoor sports at the Luberon RNP.

Useful information

Practice : WALKING

Duration : 3 h 30

Length : 11.4 km

Trek ascent : 370 m

Difficulty : Medium

Type : Boucle

Themes : Flora, Geology, Waters and rivers

Accessibility : Donkey hiking

Trek

Departure : Car park of the village, Buoux

Arrival : Car park of the village, Buoux

Markings :  GR®  GRP®  PR

Go right on the D113 and turn left. Outside the town hall, go straight. At the corner of the inn, go down to the left. Come out on the D113 (traffic!), cross the bridge and go left until the hamlet of Deyme. Continue on the dirt road, then rise slowly towards the plateau.

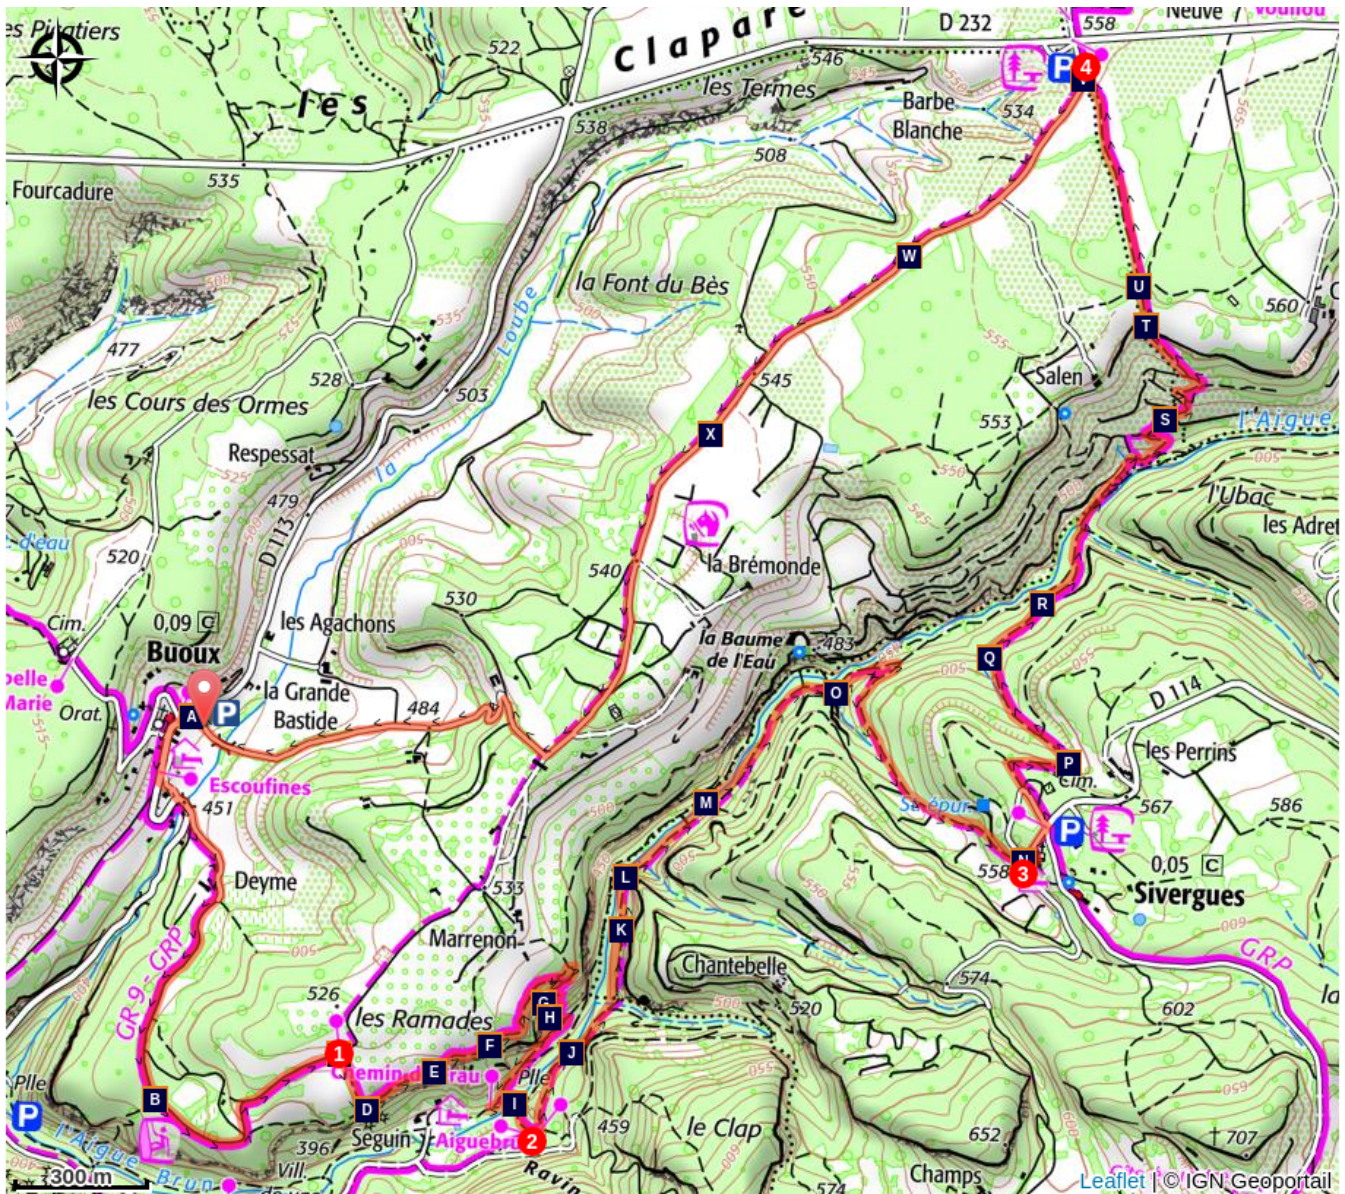

1 - At the crossroads "Les Ramades", turn right and descend to the cliff edge. Continue left on the trail that winds over the void. Further down, turn right and descend the hairpin bends "Chemin dei frau", formerly in cobblestone (careful, the GR® cuts the 1st turn). At the bottom of the hairpin bends, take a right. At the next intersection, turn left, cross the bridge and go up across.

2 - At the crossroads "Aiguebrun", turn left, then 30m further, turn left towards "Sivergues". After a succession of steep paths and small descents, spot on a flat stone the sign "Sivergues". Leave the banks of the Aiguebrun and rise gradually. Continue on the rocky path until the town of Sivergues.

3 - Climb the cobblestone across. Turn left and reach the entrance of the village. At the car park, take a left onto the Chantebelle track and at the 1st turn, continue straight on the path. Skip two corners and continue down the gravel path. Pass a cobblestone section and reach to the valley bottom. Go to the right, cross the ford of Aiguebrun and go up the opposite bank. Pass a cobblestone section and continue across on the rocky path. Pass a corner on the left then turn right at the next intersection. Go up the trail that weaves through the horse paddock. Reach the plateau and continue across on the shaded path that passes between old walls.

4 - At the crossroads "Barbe Blanche", turn left and take the small road through the Claparèdes plateau. At the crossroads "Chante Duc", continue straight, hurtle down 3 hairpin bends and continue to Buoux.

All useful information

Advices

- after point 1: passage on the edge of the void.
- between points 3 and 4: a ford.

Caution with your ankles on the numerous cobblestone and rocky areas.

Altimetric profile

Min elevation 415 m
Max elevation 567 m

Access

At 8km south of Apt by the D113 and 12km north of Lourmarin by the D943 and D113.

Advised parking

car park at the entrance of the village

On your path...

The charm of Buoux (A)

It was in the 17th century that the old village, the small Provençal church and surrounding country houses were built. The small church has a Provençal tabular altar dating back to the pre-Roman era, the present building was probably built after 1704 in the place of a small chapel. In the town hall, an oven dating from the establishment of the village can be seen, it is often repaired and maintained by the commune.

Tree sheds (B)

With their straight bills, woodpeckers drill through tree barks for nesting purposes or for extracting wood-eating insects (woodborers). In the Luberon, the Great Spotted Woodpecker (black, white with red dots) mixes with the Lesser Spotted Woodpecker (smaller with less red), the European green woodpecker and the Black Woodpecker (rarer, resembles a crow with a red cap). True social housings for insects and bats, these older trees host a multitude of inhabitants in woodpecker holes, the cracks of branches, under the ivy...

The fort of Buoux (C)

Across, on its rocky spur, the Fort of Buoux has been, for a very long time, the cornerstone of the defence system of all communication through the Luberon. Occupied since prehistoric times, it was fortified in the Middle Ages. Never stormed, it sheltered a garrison and civilians until it was dismantled on order of Louis XIV in 1660, to prevent it from falling completely into the hands of Protestants during the religious wars.

Climbing the cliffs of Buoux! (D)

To the right, right under your feet, the enormous multicoloured walls and large grey overhangs, naturally riddled with holes of all sizes, have made Buoux a world renown climbing spot. In the 1980s-90s, the cliffs were the laboratory of top international level, where many climbers became famous; Patrick Edlinger, Antoine and Marc Le Menestrel, Catherine Destivelle, Lynn Hill, etc...

The old story of the Gorges (E)

The Aiguebrun valley is distinguished by its high cliffs with limestone escarpments and its chaos of crumbled rocks. The valley grew hollow about 6 million years after the Mediterranean Sea dried out! The water level will be lowered to 1000m and the rivers that surround it will dig huge canyons which are then filled with sediment deposits. Under the action of erosion during glacial periods, the cliffs will no longer be steep.

Attribution : ©Stéphane Legal - PNR Luberon

Rare raptors protected (F)

Looking carefully, you can spot the presence of protected raptors, remarkable for their size and their cries. The Short-toed Snake Eagle, migratory, nests as of spring on old pines in the forest. European Eagle-owl seeks shelter in the cliffs throughout the year and can be heard at night. Their tranquillity is preserved in sensitive areas: organization of rock climbing, programming of logging outside breeding seasons...

Attribution : ©PNR Luberon

Molasse or mollasse? (G)

The spectacular cliffs of Aiguebrun are made of sandy limestone (which contains grains of sand) biotrital (which also contains various fossil debris). Locally, it is called molasses or mollasses according to two possible etymological origins: mola = grindstone, because this abrasive rock was used to produce grindstones. Or mollis = soft, because the rock can be sharpened and be cut easily. This is the noble stone of the quarries of Provence.

Attribution : ©Eric Garnier - PNR Luberon

Traces of marine currents! (H)

The surrounding cliffs often have ripples. It's what we call "cross-bedding" or "cross strata". These are evidence of marine origin of these rocks deposited in the sea 20 million years ago, and especially the existence of underwater currents creating a landscape of underwater dunes, embankments and gutters into the depths.

Attribution : ©Eric Garnier - PNR Luberon

Pont des Seguins (I)

Several bridges cross Aiguebrun or its tributaries. From Les Près Blancs to Seguin, we can count five of them, including Pont des Seguins, near the inn bearing the same name. It dates back to 1923. It was taken by those who wished to enter the hamlet. It consists of a large main arch that soars over 7m. A small curved opening located in the south abutment allowed the passing of a channel.

Attribution : ©PNR Luberon

The Aiguebrun river (J)

In the Mediterranean region, very few streams, more or less permanent, are bordered by a lush forest. The Aiguebrun river is one of those and with its valley, is ecologically one of the major sites of the Park. Among the fishes, you may see the Riverine Brown Trout and the Mediterranean Barbel, but also the White-clawed Crayfish, discreet and rare. The presence of these three species emphasizes the health of the aquatic ecosystem, but especially the need to preserve it.

Attribution : ©David Tatin

I hide in cliffs ... (K)

Bats, also known as Chiroptera are small mammals. Wrongfully hated, they are still mysterious beings able to live up to 30 years and have developed a fabulous echolocation system to find its way at night. This kind of ultrasonic radar bouncing off obstacles and prey also allows them to locate and capture their prey, mostly insects. An individual can consume 30% of its weight in one evening!

Attribution : ©Laurent Michel - PNR Luberon

Mediterranean Sea, where are you? (L)

Thin and long string of trees subject to the vicissitudes of the river, the riparian forest of Aiguebrun is populated by various wood species such as ash, narrow-leaved ash, common alder, various poplars and willows... It also hosts rare plant species in the Mediterranean region, taking refuge in the cool, damp atmosphere ... The Aiguebrun valley is like a sample of northern Europe which wended up in the middle of Provence!

Attribution : ©PNR Luberon

Ravine forest (M)

Between "riparian forest" (a forested area of land adjacent to a body of water) and rocky ridges, the trail passes through a beautiful forest settled on a steep and rocky slope. If, at first glance, this seems like a "classic", well it's not! This is indeed called a "ravine forest", still very rare and located in Provence. Here, there aren't any oaks (or very few!), you are now in the kingdom of maple, linden and hazel trees and a flora specialised in unstable rocky soils.

Attribution : ©Laurent Michel - PNR Luberon

Sivergues, at the end of the road (N)

The village is located at the highest point, overlooking the valleys. A sense of calm, isolation, and harmony emerges. The discovery of the village was done gradually, in the form of a big hamlet, it is located on the edge of the plateau. The structure has fitted the topography, giving it a more massive appearance. The layout of buildings and the alignment principle make each built structure open on the valley on the view of the great scenery.

Attribution : ©Marion Eyssette - PNR Luberon

Each having their exotic qualities (O)

Providing that you are able to climb a few metres of it, this small stream offers the opportunity to observe the Enchanter's-Nightshade (*Circaea lutetiana*), a discrete plant with small white flowers and strange clubbing sticky fruits and the Hart's Tongue Fern (*Asplenium Scolopendrium*), which unfolds like a tongue on shaded rocks. Common in well-watered areas, these two species are much rarer under the sun of Provence... (Protected in PACA = picking is forbidden!)

Attribution : ©Laurent Michel - PNR Luberon

Follow me, I'll follow you ! (P)

We often hear that if a sheep jumps off a cliff, he will take his entire flock with him, hence the term "follow like sheep". Are sheeps stupid? Researchers have studied the phenomenon, and this group effect is more rational than you think. Sheeps, torn between their desire to find food and to be protected from predators, regroup to explore more effectively blank spaces and circulate information more quickly in case of danger.

Attribution : ©Eric Garnier - PNR Luberon

The art of the "calade" (cobblestone pavements) (Q)

The public roadway heritage still shows remnants of facilities necessary for important human activity in the valley during the past centuries, the cobblestone path portions are the proof. The remains of the calades, pavings with cobblestones placed roughly, can be seen near the passages in the river or when climbing towards the Claparèdes plateau and Sivergues.

Attribution : ©Eric Garnier - PNR Luberon

Meadows, a rare natural heritage (R)

These meadows scattered over the valley bottom are the legacy of the work of nature and man. This well-watered area benefits a wide variety of plants and insects (butterflies, dragonflies ...). And with a little bit of luck, we can flush out a seps, a kind of slow worm with legs ... Grazing has shaped these clearings at a time when small herds could access easily. Targeted bush clearing must be able to restore them while preserving the surrounding riparian forest.

Attribution : ©Laurent Michel - PNR Luberon

The Fragrant Bug Orchid (S)

This small crossing of a slightly wet marl hill may be an opportunity, in the months of May and June, to discover a small vanilla-scented orchid: the aptly named Fragrant Bug Orchid (*Anacamptis coriophora subsp. fragrans*). Quite rare in France where it is found only in the southern part, it is strictly protected there. So let's carry away her scent in our memories!

Attribution : ©Laurent Michel - PNR Luberon

"Lou Camin Salié" (T)

& Laquo; "Lou Camin Salié" or salt road were the roads used formerly by salt merchants with their caravans of mules from the Etang de Berre. A popular condiment at the time, you had to be cunning and clever to avoid thieves and bandits. Thus, merchants passed through less accessible but more secure paths. A former salt road, the path you are currently on came from Sivergues to reach Apt through this place called "Salen", to the left.

Attribution : ©Marie Grenouilleau - PNR Luberon

A postcard scenery... (U)

The Luberon is visible from everywhere and very present in the landscape. It is also a wonderful spur which reveals wide panoramas of Mont Ventoux and the Alps to the north from the Claparèdes plateau. Do not miss the purple mottling of the lavender from June to July. Contemporary human presence is rare but the few farms, bories, dry stone walls resulting from field stone removal are the proof of an earlier human presence.

Attribution : ©Françoise Delville - PNR Luberon

The Claparèdes plateau (V)

The name Claparèdes comes from "clapas" which means "pile of rocks" in Provençal. Many dry stone huts are on this plateau which goes from Castellet to Lacoste on about 10km. An old cereal land, the cultivation of lavender is now the most widespread on the plateau.

Attribution : ©Eric Garnier - PNR Luberon

Stones, a true nightmare for farmers! (W)

The small stone huts or bories you see everywhere in the Luberon were built with stones extracted from the fields by the farmers at the time. Today it is still the same problem for farmers of the Luberon, who have to clear their fields of stones several times a year. And even if the sale of stones allows them to earn some money, these stones are a scourge for agricultural equipment, breakage and wear being common.!

Attribution : ©Magali Amir

Lavender or lavandin? (X)

Spike Lavender (commonly known as French Lavender) (*Lavandula latifolia*), with broad white leaves, is a Mediterranean plant. The English lavender (*Lavandula angustifolia*) with narrow leaves, is more of a mountainous plant (up to 1500m). Although the English lavender is sometimes cultivated in the mountains, it is usually the Lavandin, a hybrid of the two species and more productive, that we see in the fields. Warning, these crops are the result of hard farm work, please do not pick!
